Camera calibration

- **projection matrix**
  - perspective projection
  - orthographic projection

Camera calibration

- Lecture Reference at:
  - Multiple View Geometry in Computer Vision, (Chapter7)
 - Computer Vision A Modern Approach, Chapter 3 (Geometric Camera Calibration).
Camera calibration

- Problem description:
  - Camera calibration is to use precise geometric structure, then to adjust the camera parameter under measurements and constraints.
  - In short, given $\mathbf{X}_i \leftrightarrow \mathbf{x}_i$
  - then determine the mapping transformation

Camera calibration: A linear approach

- The camera mathematical model:

$$\mathbf{x}_{img} = \mathbf{K}[\mathbf{R}|\mathbf{t}]\mathbf{X}_{world}$$

- To determine the mapping matrix (3x4), rewrite as

$$\mathbf{x} = \mathbf{P} \cdot \mathbf{X}$$

(請注意，此處符號與兩本課本定義稍微不同)

National Taiwan University of
Science and Technology

TAIWAN TECH

Camera calibration: A linear approach—cont.

- Again, one feature has two constraints.
- Note : one feature means that you have already known a 3D point (in 3D space) and a projected 2D point (on image)

$$\begin{cases} (\mathbf{p}_1 - u_i \mathbf{p}_3) \cdot \mathbf{X}_i = 0 \\ (\mathbf{p}_2 - v_i \mathbf{p}_3) \cdot \mathbf{X}_i = 0 \end{cases}$$

$$\rightarrow \begin{cases} [\mathbf{p}_1 + 0 \mathbf{p}_2 + (-u_i) \mathbf{p}_3] \cdot \mathbf{X}_i = 0 \\ [0 \mathbf{p}_1 + \mathbf{p}_2 + (-v_i) \mathbf{p}_3] \cdot \mathbf{X}_i = 0 \end{cases}$$

Mapping
(unknown
to be solved)

Known(given,
ex checkerboard)

Known (measurement,
from image)

Camera
center

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

National Taiwan University of
Science and Technology

Camera calibration: A linear approach—cont.

$$\begin{cases} [\mathbf{p}_1 + 0\mathbf{p}_2 + (-u_i)\mathbf{p}_3] \cdot \mathbf{X}_i = 0 \\ [0\mathbf{p}_1 + \mathbf{p}_2 + (-v_i)\mathbf{p}_3] \cdot \mathbf{X}_i = 0 \end{cases}$$

■ So, u_i, v_i and $\mathbf{X}_i$ are known, and $\mathbf{p}_1$, $\mathbf{p}_2$ and $\mathbf{p}_3$ (12 elements) are unknown and to be solved.

■ Re-arrange the equations:

$$\begin{pmatrix} \mathbf{X}_i^{\mathrm{T}} & 0^{\mathrm{T}} & -u_i\mathbf{X}_i^{\mathrm{T}} \\ 0^{\mathrm{T}} & \mathbf{X}_i^{\mathrm{T}} & -v_i\mathbf{X}_i^{\mathrm{T}} \end{pmatrix}_{2 \times 12} \begin{pmatrix} \mathbf{p}_1 \\ \mathbf{p}_2 \\ \mathbf{p}_3 \end{pmatrix}_{12 \times 1} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}_{2 \times 1}$$

# Camera calibration: A linear approach—cont.

- In practice, given n features:

$$
\begin{bmatrix}
\begin{pmatrix}
\mathbf{X}_1^{\mathrm{T}} & 0^{\mathrm{T}} & -u_1\mathbf{X}_1^{\mathrm{T}} \\
0^{\mathrm{T}} & \mathbf{X}_1^{\mathrm{T}} & -v_1\mathbf{X}_1^{\mathrm{T}}
\end{pmatrix} \\
\begin{pmatrix}
\mathbf{X}_2^{\mathrm{T}} & 0^{\mathrm{T}} & -u_2\mathbf{X}_2^{\mathrm{T}} \\
0^{\mathrm{T}} & \mathbf{X}_2^{\mathrm{T}} & -v_2\mathbf{X}_2^{\mathrm{T}}
\end{pmatrix} \\
\cdots\cdots \\
\begin{pmatrix}
\mathbf{X}_n^{\mathrm{T}} & 0^{\mathrm{T}} & -u_n\mathbf{X}_n^{\mathrm{T}} \\
0^{\mathrm{T}} & \mathbf{X}_n^{\mathrm{T}} & -v_n\mathbf{X}_n^{\mathrm{T}}
\end{pmatrix}
\end{bmatrix}_{2n\times12}
\begin{pmatrix}
\mathbf{p}_1 \\
\mathbf{p}_2 \\
\mathbf{p}_3
\end{pmatrix}_{12\times1}
=
\begin{pmatrix}
0 \\ 0 \\ 0 \\ 0 \\ \cdots \\ 0 \\ 0
\end{pmatrix}_{2n\times1}
$$

- Solution? At least 6 features are needed for solving 12-1 unknowns.
- Least square or SVD…

Camera calibration: A linear approach—cont.

- A simple framework:
 - 3D Checkerboard → known 3D points
  - 2D feature → projected on image

Gold Standard algorithm

- **<u>Objective</u>**
- Given n≥6 3D to 2D point correspondences $\{\mathbf{X}_i \leftrightarrow \mathbf{x}_i'\}$, determine the Maximum Likelyhood Estimation of mapping transformation **P**

- **<u>Algorithm</u>**

  (i) Linear solution:

     (a) Normalization:

     (b) DLT (using SVD or least-square …) → get $\tilde{\mathbf{P}}$

  (ii) Minimization of geometric error: using the linear estimate as a starting point minimize the geometric error. (RANSIC)

  (iii) Denormalization.

$$\mathbf{P} = \left([\mathbf{s}][\mathbf{t}]_{3\times3}\right)^{-1} \tilde{\mathbf{P}} \cdot \left([\mathbf{S}][\mathbf{T}]_{4\times4}\right)$$

Algorithm 7.1 [Hartley04]

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

National Taiwan University of
Science and Technology

Gold Standard algorithm—cont.

$$\mathbf{x} = \mathbf{P} \cdot \mathbf{X}$$

normalization

$$\tilde{\mathbf{x}} = \tilde{\mathbf{P}} \cdot \tilde{\mathbf{X}}$$

Step-1a $\qquad \tilde{\mathbf{X}} = \big[[\mathbf{S}][\mathbf{T}] \big]_{4 \times 4} \mathbf{X} \qquad \rightarrow$ normalization (3D points)

Translate center to the origin

Scale all points to the unit cube (or average the vector distance to be 1.414 or $\sqrt{2}$ $\rightarrow$ textbook suggestion value)

$$\tilde{\mathbf{x}} = \big[[\mathbf{s}][\mathbf{t}] \big]_{3 \times 3} \mathbf{x} \qquad \rightarrow$$ normalization (2D points)

19

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

TAIWAN TECH
National Taiwan University of Science and Technology

Gold Standard algorithm—cont.

Step-1b

$$\tilde{\mathbf{x}} = \tilde{\mathbf{P}} \cdot \tilde{\mathbf{X}}$$

→ solve $\tilde{\mathbf{P}}$ by SVD or least-square method

Hint:

$$\begin{bmatrix} \begin{pmatrix} \mathbf{X}_1^T & \mathbf{0}^T & -u_1\mathbf{X}_1^T \\ \mathbf{0}^T & \mathbf{X}_1^T & -v_1\mathbf{X}_1^T \end{pmatrix} \\ \begin{pmatrix} \mathbf{X}_2^T & \mathbf{0}^T & -u_2\mathbf{X}_2^T \\ \mathbf{0}^T & \mathbf{X}_2^T & -v_2\mathbf{X}_2^T \end{pmatrix} \\ \cdots\cdots \\ \begin{pmatrix} \mathbf{X}_n^T & \mathbf{0}^T & -u_n\mathbf{X}_n^T \\ \mathbf{0}^T & \mathbf{X}_n^T & -v_n\mathbf{X}_n^T \end{pmatrix} \end{bmatrix}_{2n\times12} \begin{pmatrix} \mathbf{p}_1 \\ \mathbf{p}_2 \\ \mathbf{p}_3 \end{pmatrix}_{12\times1} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ \cdots \\ 0 \\ 0 \end{pmatrix}_{2n\times1}$$

Step-2 → minimize the re-projection error, if necessary.

Gold Standard algorithm—cont.

Step-3 De-normalization (determine **P**)

$$\mathbf{x} = \mathbf{P} \cdot \mathbf{X}$$

$$\mathbf{P} = \left([\mathbf{s}|\mathbf{t}]_{3 \times 3} \right)^{-1} \tilde{\mathbf{P}} \cdot \left([\mathbf{S}|\mathbf{T}]_{4 \times 4} \right)$$
$$\tilde{\mathbf{x}} = \tilde{\mathbf{P}} \cdot \tilde{\mathbf{X}}$$

$$[\mathbf{s}|\mathbf{t}]_{3 \times 3} \mathbf{x} = \tilde{\mathbf{P}} \left([\mathbf{S}|\mathbf{T}]_{4 \times 4} \mathbf{X} \right)$$

$$\mathbf{x} = \left([\mathbf{s}|\mathbf{t}]_{3 \times 3} \right)^{-1} \tilde{\mathbf{P}} \left([\mathbf{S}|\mathbf{T}]_{4 \times 4} \right) \mathbf{X}$$

$$\therefore \mathbf{P} = \left([\mathbf{s}|\mathbf{t}]_{3 \times 3} \right)^{-1} \tilde{\mathbf{P}} \cdot \left([\mathbf{S}|\mathbf{T}]_{4 \times 4} \right)$$

  - Computer Vision A Modern Approach, NA
  - Select paper: Zhang, Z. 1999. Flexible camera calibration by viewing a plane from unknown orientations. *IEEE International Conference on Computer Vision, 1, (1999), 666-673.*
Camera calibration

■ **Intrinsic parameter calibration**

1. From absolute conic
2. From homography

Camera calibration

- From absolute conic
  - Points on the plane at infinity and absolute conic

$$\mathbf{x} = \mathbf{P} \cdot \mathbf{X}_\infty$$

$$\mathbf{x} = \mathbf{K}[\mathbf{R}|\mathbf{t}] \cdot \mathbf{X}_\infty$$

$\mathbf{X}_\infty$ is one 3D point at infinity. Let $\mathbf{X}_\infty = \begin{vmatrix} \mathbf{d}_{3\times1} \\ 0 \end{vmatrix}$

$$\mathbf{x} = \mathbf{K}[\mathbf{R}|\mathbf{t}] \cdot \mathbf{X}_\infty = \mathbf{K}[\mathbf{R}|\mathbf{t}] \cdot \begin{vmatrix} \mathbf{d}_{3\times1} \\ 0 \end{vmatrix}$$

$$\mathbf{x} = \mathbf{K}\mathbf{R}\mathbf{d} \longrightarrow \text{2D point to 2D point mapping} \rightarrow \text{homography}$$

$$\mathbf{x} = \mathbf{H}\mathbf{d}$$

Camera calibration

- From absolute conic—cont.
  - Points on the plane at infinity and absolute conic

  - The mapping between $\boldsymbol{\pi}_\infty$ and an image is given by the planar homography $\mathbf{x} = \mathbf{Hd}$ with

$$\mathbf{H} = \mathbf{KR}$$

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

National Taiwan University of
Science and Technology

Camera calibration

- From absolute conic—cont.

  – Points on the plane at infinity and absolute conic

- Recall the property of the conic: if one point is on the conic C, it forms

$$\mathbf{x}^{\mathsf{T}}\mathbf{C}\mathbf{x}=0$$

- For example, one ellipse:

$$\begin{bmatrix} x & y & 1 \end{bmatrix}\begin{bmatrix} 5 & 0 & 4 \\ 0 & 15 & 1 \\ 4 & 1 & -11 \end{bmatrix}\begin{bmatrix} x \\ y \\ 1 \end{bmatrix}=0$$
Camera calibration

- From absolute conic—cont.
  - Points on the plane at infinity and absolute conic

- Absolute conic $\mathbf{\Omega}_\infty$: the a (point) conic on $\mathbf{\pi}_\infty = (0,0,0,1)^\mathrm{T}$

$$\mathbf{X}_\infty = (X_1, X_2, X_3, X_4)$$

$$\begin{cases} X_1^2 + X_2^2 + X_3^2 = 0 \\ X_4 = 0 \end{cases}$$

$$(X_1, X_2, X_3)\mathbf{I}(X_1, X_2, X_3)^\mathrm{T} = 0$$

$$\mathbf{C} = \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

Camera calibration

- From absolute conic—cont.

  – Points on the plane at infinity and absolute conic

- **The *image of the absolute* conic (called IAC) is the conic :**

$$\boldsymbol{\omega} = (\mathbf{K}\mathbf{K}^{\mathrm{T}})^{-1}$$

- Proof: $\mathbf{x}' = \mathbf{H}\mathbf{x}$ → points **x** are mapped to **x'** by homography **H**

  $\mathbf{C}' = \mathbf{H}^{-\mathrm{T}}\mathbf{C}\mathbf{H}^{-1}$ → conic **C** will be mapped to **C'** (according this eqs)

- Since we want to determine the mapping result (says **ω** as a new notation) of the absolute conic (**C=I**), the **H=KR**

$$\boldsymbol{\omega} = \mathbf{H}^{-\mathrm{T}}\mathbf{I}\mathbf{H}^{-1} = (\mathbf{K}\mathbf{R})^{-\mathrm{T}}\mathbf{I}(\mathbf{K}\mathbf{R})^{-1} = \mathbf{K}^{-\mathrm{T}}\mathbf{R}^{-\mathrm{T}}\mathbf{I}\mathbf{R}^{-1}\mathbf{K}^{-1}$$

$$= \mathbf{K}^{-\mathrm{T}}\mathbf{R}\mathbf{I}\mathbf{R}^{-1}\mathbf{K}^{-1} = \mathbf{K}^{-\mathrm{T}}\mathbf{K}^{-1} = (\mathbf{K}\mathbf{K}^{\mathrm{T}})^{-1}$$

to determine **K** from a known **ω**, Cholesky factorization is used.

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

National Taiwan University of
Science and Technology

Camera calibration

- From absolute conic—cont.

  - Points on the plane at infinity and absolute conic

- **Absolute conic:** points $\begin{bmatrix} 1 & \pm i & 0 \end{bmatrix}$ are on absolute conic (imaginary point).

$$\begin{bmatrix} 1 & \pm i & 0 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ \pm i \\ 0 \end{bmatrix} = 0$$
Points at infinity plane (and on absolute conic)

- Suppose these points can be mapped by a known **H**, the mapped points will be

$$\mathbf{H} \begin{bmatrix} 1 \\ \pm i \\ 0 \end{bmatrix} = \begin{bmatrix} \mathbf{h}_1 & \mathbf{h}_2 & \mathbf{h}_3 \end{bmatrix} \begin{bmatrix} 1 \\ \pm i \\ 0 \end{bmatrix} = \mathbf{h}_1 \pm i\mathbf{h}_2$$

Points mapping back (via homography) to image plane

33

National Taiwan University of Science and Technology

3D Points on the plane at infinity and absolute conic

$$\mathbf{\Omega}_\infty = (X_1, X_2, X_3, X_4)$$

$$\infty$$

$$\mathbf{X}_\infty = (X_1, X_2, X_3, X_4) \qquad \mathbf{\pi}_\infty = (0,0,0,1)^T$$

$$\mathbf{H} = \mathbf{KR}$$

$$\mathbf{C} = \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

Image plane (taken pic)

$$\omega$$

$$\mathbf{x}' = \mathbf{Hx}$$

$$\mathbf{C} = \mathbf{H}^{-T} \mathbf{C} \mathbf{H}^{-1}$$

$$\omega = \mathbf{H}^{-T} \mathbf{\Omega}_\infty \mathbf{H}^{-1}$$

$$\omega = (\mathbf{KR})^{-T} \mathbf{\Omega}_\infty (\mathbf{KR})^{-1}$$

Camera calibration

- From absolute conic—cont.
  - Points on the plane at infinity and absolute conic

- According the "points on conic" equation $\mathbf{x}^T\mathbf{C}\mathbf{x}=0$

$$(\mathbf{h}_1 \pm i\mathbf{h}_2)^T \boldsymbol{\omega}(\mathbf{h}_1 \pm i\mathbf{h}_2)=0$$

The mapping back points will be on the conic

- Deal with real part & imaginary part individually:

$$\mathbf{h}_1^T\boldsymbol{\omega}\mathbf{h}_1+i^2\mathbf{h}_2^T\boldsymbol{\omega}\mathbf{h}_2+2i(\mathbf{h}_1^T\boldsymbol{\omega}\mathbf{h}_2)=0$$

$$\mathbf{h}_1^T\boldsymbol{\omega}\mathbf{h}_2=0$$
$$\mathbf{h}_1^T\boldsymbol{\omega}\mathbf{h}_1=\mathbf{h}_2^T\boldsymbol{\omega}\mathbf{h}_2$$

Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

National Taiwan University of
Science and Technology

Camera calibration

- Summary: A simple calibration from the absolute conic
  - Step-1: compute **H** for each square →for example 3 squares induce 3 **H** (unit corners (0,0),(1,0),(0,1),(1,1))
  - Step-2: compute the imaged circular points $\mathbf{H}(1,\pm i,0)^T$
  - Step-3: fit a conic to 6 circular points **ω**→ SVD
  - Step-4: compute **K** from **ω** through Cholesky factorization

[algorithm from Hartley textbook example8.18]

Science and Technology

Camera calibration

- Example: from absolute conic—cont.

$$h_{11}h_{21}\omega_1+(h_{11}h_{22}+h_{12}h_{21})\omega_2+(h_{11}h_{23}+h_{13}h_{21})\omega_3+h_{12}h_{22}\omega_2+(h_{12}h_{23}+h_{13}h_{22})\omega_{23}+h_{13}h_{23}\omega_{33}=0$$

$$(h_{11}h_{11}-h_{21}h_{21})\omega_1+(h_{11}h_{12}+h_{12}h_{11}-h_{21}h_{22}-h_{22}h_{21})\omega_2+(h_{11}h_{13}+h_{13}h_{11}-h_{21}h_{23}-h_{23}h_{21})\omega_3+(h_{12}h_{12}-h_{22}h_{22})\omega_{22}$$
$$+(h_{12}h_{13}+h_{13}h_{12}-h_{22}h_{23}-h_{23}h_{22})\omega_{23}+(h_{13}h_{13}-h_{23}h_{23})\omega_{33}=0$$

$$\Rightarrow \begin{bmatrix} h_{11}h_{21} & (h_{11}h_{22}+h_{12}h_{21}) & (h_{11}h_{23}+h_{13}h_{21}) & h_{12}h_{22} & (h_{12}h_{23}+h_{13}h_{22}) & h_{13}h_{23} \\ (h_{11}^2-h_{21}^2) & 2(h_{11}h_{12}-h_{21}h_{22}) & 2(h_{11}h_{13}-h_{21}h_{23}) & (h_{12}^2-h_{22}^2) & 2(h_{12}h_{13}-h_{22}h_{23}) & (h_{13}^2-h_{23}^2) \end{bmatrix} \begin{bmatrix} \omega_1 \\ \omega_2 \\ \omega_3 \\ \omega_{22} \\ \omega_{23} \\ \omega_{33} \end{bmatrix}=0$$

Two constraints from one homography

6 unknowns (actually 5 unknowns upto scale), so it needs at least **3** homography

A=[
h(1,1)*h(2,1) h(1,1)*h(2,2)+h(1,2)*h(2,1) h(1,1)*h(2,3)+h(1,3)*h(2,1) h(1,2)*h(2,2) h(1,2)*h(2,3)+h(1,3)*h(2,2) h(1,3)*h(2,3);
h(1,1)^2-h(2,1)^2 2*(h(1,1)*h(1,2)-h(2,1)*h(2,2)) 2*(h(1,1)*h(1,3)-h(2,1)*h(2,3)) h(1,2)^2-h(2,2)^2
2*(h(1,2)*h(1,3)-h(2,2)*h(2,3)) h(1,3)^2-h(2,3)^2]

BE CAREFUL! This notation is different from Matlab.

Camera calibration

- Example: from absolute conic—cont.
  - To determine K in $\boldsymbol{\omega} = (\mathbf{K}\mathbf{K}^{\mathrm{T}})^{-1}$

Assume $\mathbf{K} = \begin{bmatrix} a & b & c \\ 0 & d & e \\ 0 & 0 & 1 \end{bmatrix}$ $\Rightarrow$ $\boldsymbol{\omega}^{-1} = \begin{bmatrix} \varpi_{11} & \varpi_{12} & \varpi_{13} \\ \varpi_{21} & \varpi_{22} & \varpi_{23} \\ \varpi_{31} & \varpi_{32} & \varpi_{33} \end{bmatrix} = s^2 \begin{bmatrix} a & b & c \\ 0 & d & e \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} a & b & c \\ 0 & d & e \\ 0 & 0 & 1 \end{bmatrix}^{\mathrm{T}}$

$$= s^2 \begin{bmatrix} a & b & c \\ 0 & d & e \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} a & 0 & 0 \\ b & d & 0 \\ c & e & 1 \end{bmatrix} = s^2 \begin{bmatrix} a^2 + b^2 + c^2 & bd + ce & c \\ bd + ce & d^2 + e^2 & e \\ c & e & 1 \end{bmatrix}$$

$$\boldsymbol{\omega}^{-1} = \begin{bmatrix} \varpi_{11} & \varpi_{12} & \varpi_{13} \\ \varpi_{21} & \varpi_{22} & \varpi_{23} \\ \varpi_{31} & \varpi_{32} & \varpi_{33} \end{bmatrix} = s^2 \begin{bmatrix} a^2 + b^2 + c^2 & bd + ce & c \\ bd + ce & d^2 + e^2 & e \\ c & e & 1 \end{bmatrix} \qquad s = \pm \sqrt{\varpi_{33}}$$

National Taiwan University of Science and Technology

Camera calibration

- Example: from absolute conic—cont.

$$\begin{bmatrix} \varpi_{11} & \varpi_{12} & \varpi_{13} \\ \varpi_{21} & \varpi_{22} & \varpi_{23} \\ \varpi_{31} & \varpi_{32} & \varpi_{33} \end{bmatrix} = s^2 \begin{bmatrix} a^2+b^2+c^2 & bd+ce & c \\ bd+ce & d^2+e^2 & e \\ c & e & 1 \end{bmatrix}$$

let $\varpi_{33}=1$

then, $c=\varpi_{13}$

$e=\varpi_{23}$

Solve d: (by 2nd row, 2nd column) $d=\pm\sqrt{\varpi_{22}-e^2}$ (use positive value)

Solve e:(by 1st row, 2nd column) $b=(\varpi_{12}-ce)/d$

Solve a:(by 1st row, 1st column) $a=\pm\sqrt{\varpi_{11}-b^2-c^2}$ (use positive value)

Finally, $\mathbf{K}=\begin{vmatrix} a & b & c \\ 0 & d & e \\ 0 & 0 & 1 \end{vmatrix}$

Another solution for $\boldsymbol{\omega}=(\mathbf{KK}^T)^{-1}$ is Cholesky factorization (matlab2011)

Camera calibration

- Example: from absolute conic—cont.

  Of course you can assume $\mathbf{K} = \begin{bmatrix} a & 0 & c \\ 0 & d & e \\ 0 & 0 & 1 \end{bmatrix}$, since most digital CCDs have NO (or tiny) skew effect.

$$\boldsymbol{\omega}^{-1} = \begin{bmatrix} \varpi_{11} & \varpi_{12} & \varpi_{13} \\ \varpi_{21} & \varpi_{22} & \varpi_{23} \\ \varpi_{31} & \varpi_{32} & \varpi_{33} \end{bmatrix} = s^2 \begin{vmatrix} a^2 + c^2 & ce & c \\ ce & d^2 + e^2 & e \\ c & e & 1 \end{vmatrix}$$

  let $\varpi_{33} = 1$

  then, $c = \varpi_{13}$

  $e = \varpi_{23}$

  Solve d: (by 2nd row, 2nd column) $d = \pm\sqrt{\varpi_{22} - e^2}$ (use positive value)

  Solve a:(by 1st row, 1st column) $a = \pm\sqrt{\varpi_{11} - c^2}$ (use positive value)

  Check $|\varpi_{12} - ce|$ value, if it is not neglected, this assumption is poor.

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

National Taiwan University of Science and Technology

Solution in Matlab (for example)

$$\begin{bmatrix} h_1h_{21} & (h_1h_{22}+h_1h_{21}) & (h_1h_{23}+h_1h_{21}) & h_1h_{22} & (h_1h_{23}+h_1h_{22}) & h_1h_{23} \\ (h_{11}^2-h_{21}^2) & 2(h_1h_{12}-h_2h_{22}) & 2(h_1h_{13}-h_2h_{23}) & (h_{12}^2-h_{22}^2) & 2(h_1h_{13}-h_2h_{23}) & (h_{13}^2-h_{23}^2) \end{bmatrix} \begin{bmatrix} \omega_{11} \\ \omega_{12} \\ \omega_{13} \\ \omega_{22} \\ \omega_{23} \\ \omega_{33} \end{bmatrix} = 0$$

Step-1 determine every homography
(in this example 3 square→ 3 homography)

Step-2 determine every **h**1 & **h**2 from 3 homography. One homography gives two equations (constraints)
(NOTE! The transpose operation is ONLY for notation purpose in Matlab)

```
>> hap=ha'            >> hbp=hb'            >> hcp=hc'

hap =                 hbp =                 hcp =
```

h1 | 379.1997 | -64.1403 | 0.1021 | | 168.2714 | 81.9609 | -0.1489 | | 228.9700 | 41.6167 | -0.0782
h2 | 111.8308 | 350.8263 | 0.2102 | | 125.7632 | 320.4780 | 0.2110 | | -209.5729 | 105.1782 | -0.1824
| 152.0000 | 149.0000 | 1.0000 | | 596.0000 | 84.0000 | 1.0000 | | 490.0000 | 387.0000 | 1.0000

Step-3 construct the matrix form, then solve it by SVD for determine ω.

```
A=[hap(1,1)*hap(2,1) hap(1,1)*hap(2,2)+hap(1,2)*hap(2,1) hap(1,1)*hap(2,3)+hap(1,3)*hap(2,1) hap(1,2)*hap(2,2) hap(1,2)*hap(2,3)+hap(1,3)*hap(2,2) hap(1,3)*hap(2,3);
hap(1,1)^2-hap(2,1)^2 2*(hap(1,1)*hap(1,2)-hap(2,1)*hap(2,2)) 2*(hap(1,1)*hap(1,3)-hap(2,1)*hap(2,3)) hap(1,2)^2-hap(2,2)^2 2*(hap(1,2)*hap(1,3)-hap(2,2)*hap(2,3)) hap(1,3)^2-hap(2,3)^2;
hbp(1,1)*hbp(2,1) hbp(1,1)*hbp(2,2)+hbp(1,2)*hbp(2,1) hbp(1,1)*hbp(2,3)+hbp(1,3)*hbp(2,1) hbp(1,2)*hbp(2,2) hbp(1,2)*hbp(2,3)+hbp(1,3)*hbp(2,2) hbp(1,3)*hbp(2,3);
hbp(1,1)^2-hbp(2,1)^2 2*(hbp(1,1)*hbp(1,2)-hbp(2,1)*hbp(2,2)) 2*(hbp(1,1)*hbp(1,3)-hbp(2,1)*hbp(2,3)) hbp(1,2)^2-hbp(2,2)^2 2*(hbp(1,2)*hbp(1,3)-hbp(2,2)*hbp(2,3)) hbp(1,3)^2-hbp(2,3)^2;
hcp(1,1)*hcp(2,1) hcp(1,1)*hcp(2,2)+hcp(1,2)*hcp(2,1) hcp(1,1)*hcp(2,3)+hcp(1,3)*hcp(2,1) hcp(1,2)*hcp(2,2) hcp(1,2)*hcp(2,3)+hcp(1,3)*hcp(2,2) hcp(1,3)*hcp(2,3);
hcp(1,1)^2-hcp(2,1)^2 2*(hcp(1,1)*hcp(1,2)-hcp(2,1)*hcp(2,2)) 2*(hcp(1,1)*hcp(1,3)-hcp(2,1)*hcp(2,3)) hcp(1,2)^2-hcp(2,2)^2 2*(hcp(1,2)*hcp(1,3)-hcp(2,2)*hcp(2,3)) hcp(1,3)^2-hcp(2,3)^2]
```

Camera calibration

- from homography—Zhang's method—cont.

  ■ The idea:

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

National Taiwan University of Science and Technology
Camera calibration

- from homography—Zhang's method—cont.

Points on a 3D plane:

$$\mathbf{x} = \mathbf{PX} = \begin{bmatrix} \mathbf{p}_1 & \mathbf{p}_2 & \mathbf{p}_3 & \mathbf{p}_4 \end{bmatrix} \begin{bmatrix} X \\ Y \\ 0 \\ 1 \end{bmatrix} = \begin{bmatrix} \mathbf{p}_1 & \mathbf{p}_2 & \mathbf{p}_4 \end{bmatrix} \begin{bmatrix} X \\ Y \\ 1 \end{bmatrix}$$

Recall the pin-hole projection formula:

$$\mathbf{x} = \mathbf{PX} = \mathbf{K}[\mathbf{R}|\mathbf{t}]\mathbf{X}$$

K: intrinsic parameter.
[**R**|**t**]: extrinsic parameter

can be reduced to:

$$\mathbf{x} = s\begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \mathbf{K}[\mathbf{r}_1 \quad \mathbf{r}_2 \quad \mathbf{t}]\begin{bmatrix} X \\ Y \\ 1 \end{bmatrix} = \mathbf{H}\begin{bmatrix} X \\ Y \\ 1 \end{bmatrix}$$

The mapping (indeed homography) can be defined as

$$\mathbf{H} = \mathbf{K}[\mathbf{r}_1 \quad \mathbf{r}_2 \quad \mathbf{t}]$$

Remark: **H** consists of intrinsic and part of extrinsic parameters

Note the notation in paper.

1x3 column vector

National Taiwan University of
Science and Technology

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

Camera calibration

- from homography—Zhang's method—cont.

  Since homography is up to scale, we define 3 column vectors for **H** and rewrite the equation:

$$\mathbf{H}=\mathbf{K}[\mathbf{r}_1 \quad \mathbf{r}_2 \quad \mathbf{t}] \quad \rightarrow \quad [\mathbf{h}_1 \quad \mathbf{h}_2 \quad \mathbf{h}_3]=\lambda\mathbf{K}[\mathbf{r}_1 \quad \mathbf{r}_2 \quad \mathbf{t}]$$

  here, some information is important:

$$\begin{cases}\mathbf{h}_1 = \lambda\mathbf{K}\mathbf{r}_1 \\ \mathbf{h}_2 = \lambda\mathbf{K}\mathbf{r}_2\end{cases} \rightarrow \begin{cases}\mathbf{r}_1 = \dfrac{1}{\lambda}\mathbf{K}^{-1}\mathbf{h}_1 \\ \mathbf{r}_2 = \dfrac{1}{\lambda}\mathbf{K}^{-1}\mathbf{h}_2\end{cases}$$

  Recall the behavior of "**Rotation Matrix**": orthogonal & unit length

  Orthogonal: inner product=0 → $\mathbf{r}_1^{\mathrm{T}}\mathbf{r}_2 = 0$

  unit length: the same length→ $\mathbf{r}_1^{\mathrm{T}}\mathbf{r}_1 = \mathbf{r}_2^{\mathrm{T}}\mathbf{r}_2$

TAIWAN TECH — National Taiwan University of Science and Technology

電腦視覺與應用(CI5336701)
Computer Vision and Applications, 2017 SPRING
Graduate Institute of Color and Illumination Technology

Camera calibration

- from homography—Zhang's method—cont.

$$\begin{cases} \mathbf{r}_1^T\mathbf{r}_2 = 0 \\ \mathbf{r}_1^T\mathbf{r}_1 = \mathbf{r}_2^T\mathbf{r}_2 \end{cases} \qquad \begin{cases} (\mathbf{K}^{-1}\mathbf{h}_1)^T(\mathbf{K}^{-1}\mathbf{h}_2) = 0 \\ (\mathbf{K}^{-1}\mathbf{h}_1)^T(\mathbf{K}^{-1}\mathbf{h}_1) = (\mathbf{K}^{-1}\mathbf{h}_2)^T(\mathbf{K}^{-1}\mathbf{h}_2) \end{cases}$$

$$\rightarrow \begin{cases} \mathbf{h}_1^T(\mathbf{K}^{-T}\mathbf{K}^{-1})\mathbf{h}_2 = 0 \\ \mathbf{h}_1^T(\mathbf{K}^{-T}\mathbf{K}^{-1})\mathbf{h}_1 = \mathbf{h}_2^T(\mathbf{K}^{-T}\mathbf{K}^{-1})\mathbf{h}_2 \end{cases}$$

→ The same result with absolute conic method

$$\mathbf{h}_1^T\boldsymbol{\omega}\mathbf{h}_2 = 0$$
$$\mathbf{h}_1^T\boldsymbol{\omega}\mathbf{h}_1 = \mathbf{h}_2^T\boldsymbol{\omega}\mathbf{h}_2$$

$$\boldsymbol{\omega} = (\mathbf{K}\mathbf{K}^T)^{-1}$$

Summary:

$$\mathbf{v}_{ij} = [h_{i1}h_{j1} \quad h_{i1}h_{j2}+h_{i2}h_{j1} \quad h_{i2}h_{j2} \quad h_{i3}h_{j1}+h_{i1}h_{j3} \quad h_{i3}h_{j2}+h_{i2}h_{j3} \quad h_{i3}h_{j3}]^T$$

$$\begin{bmatrix} \mathbf{v}_{12}^T \\ (\mathbf{v}_{11}-\mathbf{v}_{22})^T \end{bmatrix}\boldsymbol{\omega} = 0 \quad \text{and} \quad \boldsymbol{\omega} = (\mathbf{K}\mathbf{K}^T)^{-1}$$

$$\mathbf{v}_{ij}^T\mathbf{b} = 0$$

Note, the difference between $\boldsymbol{\omega}$ and $\mathbf{b}$

$$\mathbf{b} = [B_{11} \quad B_{12} \quad B_{22} \quad B_{13} \quad B_{23} \quad B_{33}]^T$$

Camera calibration

- Draw camera positions relative to "Single Square"

$$\mathbf{X}_{\text{cam}} = \begin{bmatrix} u_x' & v_x' & w_x' & t_x \\ u_y' & v_y' & w_y' & t_y \\ u_z' & v_z' & w_z' & t_z \\ 0 & 0 & 0 & 1 \end{bmatrix}^{-1} \cdot \mathbf{X}_{\text{world}}$$
- Draw squares respective to Single camera draw

$$[\mathbf{R}\,|\,\mathbf{t}] \begin{vmatrix} 0 \\ 0 \\ 0 \\ 1 \end{vmatrix}, [\mathbf{R}\,|\,\mathbf{t}] \begin{vmatrix} 1 \\ 0 \\ 0 \\ 1 \end{vmatrix}, [\mathbf{R}\,|\,\mathbf{t}] \begin{vmatrix} 1 \\ 1 \\ 0 \\ 1 \end{vmatrix}, [\mathbf{R}\,|\,\mathbf{t}] \begin{vmatrix} 0 \\ 1 \\ 0 \\ 1 \end{vmatrix}$$
Note! the result is up to scale, unless the actual size is known

Camera calibration

- Other resources:

Camera calibration toolbox for Matlab
Modern CCD cameras are usually capable of a spatial accuracy greater than 1/50 of the pixel size. However, such accuracy is not easily attained due to various error sources that can affect the image formation process. Current calibration methods typically assume that the observations are unbiased, the only error is the zero-mean independent and identically distributed random noise in the observed image coordinates, and the camera model completely explains the mapping between the 3D coordinates and the image coordinates. In general, these conditions are not met, causing the calibration results to be less accurate than expected.

Camera calibration

- Deal with the lens distortion:
Traditional Method: Refer to this book
C. C. Slama, editor. Manual of Photogrammetry. American Society of Photogrammetry, 4th ed., 1980.

Camera calibration

- Lens distortion from Zhang's method

  $[u \quad v \quad 1]^T$ →ideal points on image (distortion-free)

  $[\bar{u} \quad \bar{v} \quad 1]^T$ →measurement points on image (distortion)

  $[x \quad y \quad 1]^T$ →ideal points on real 3D space (normalized, distortion-free)

  $[\bar{x} \quad \bar{y} \quad 1]^T$ →measurement on real 3D space (normalized, distortion)

  Radial distortion model:

  $$\begin{cases} \bar{x} = x + x[k_1(x^2 + y^2) + k_2(x^2 + y^2)^2] \\ \bar{y} = y + y[k_1(x^2 + y^2) + k_2(x^2 + y^2)^2] \end{cases}$$
Camera calibration

- Lens distortion from Zhang's method—cont.

$$\mathbf{x}=\mathbf{P}\cdot\mathbf{X}=\mathbf{K}[\mathbf{R}|\mathbf{t}]\mathbf{X}$$

$$\mathbf{K}=\begin{vmatrix} \alpha & c & u_0 \\ 0 & \beta & v_0 \\ 0 & 0 & 1 \end{vmatrix}$$

$$\begin{bmatrix} x & y & 1 \end{bmatrix}^T$$

$$\begin{cases} \breve{x}=x+x[k_1(x^2+y^2)+k_2(x^2+y^2)^2] \\ \breve{y}=y+y[k_1(x^2+y^2)+k_2(x^2+y^2)^2] \end{cases}$$

$$\begin{cases} \breve{u}=u_0+\alpha\breve{x}+c\breve{y} \\ \breve{v}=v_0+\beta\breve{y} \end{cases}$$

Initial guess

$$\begin{cases} \breve{u}=u+(u-u_0)[k_1(x^2+y^2)+k_2(x^2+y^2)^2] \\ \breve{v}=v+(v-v_0)[k_1(x^2+y^2)+k_2(x^2+y^2)^2] \end{cases}$$
Alternatively solve k_1, k_2.

$$\begin{vmatrix} (u-u_0)(x^2+y^2) & (u-u_0)(x^2+y^2)^2 \\ (v-v_0)(x^2+y^2) & (v-v_0)(x^2+y^2)^2 \end{vmatrix}\begin{vmatrix} k_1 \\ k_2 \end{vmatrix}=\begin{vmatrix} \breve{u}-u \\ \breve{v}-v \end{vmatrix}$$
→solve by SVD, then iteratively minimize the error
